Ceramicx is using NPE to discuss the benefits of its infrared heating systems to thermoformers and blow moulders. "Despite the advances in fracking and shale gas, US manufacturing industry is still being incentivised to go green. For many thermoformers this means an adoption of IR-based heating and sophisticated control as a way of increasing accuracy and saving cost," explained Frank Wilson, Ceramicx Founder and Managing Director. "The primary benefit is that the customer is offered improved efficiency through decreased energy usage, increased production, reduced scrap and downtime." Ceramicx will be exhibiting its systems alongside US distributor, Weco International.
